

# EE5609 Assignment 13

SHANTANU YADAV, EE20MTECH12001

## 1 PROBLEM

- a) Let  $\mathbf{F}$  be a field and let  $\mathbf{V}$  be the space of polynomial functions  $f$  from  $\mathbf{F}$  into  $\mathbf{F}$ , given by

$$f(x) = c_0 + c_1x + \cdots + c_nx^n$$

Let  $\mathbf{D}$  be a linear differentiation transformation defined as

$$(\mathbf{D}f)(x) = \frac{df(x)}{dx}$$

Then find the range and null space of  $\mathbf{D}$ .

- b) Let  $\mathbf{R}$  be the field of real numbers and let  $\mathbf{V}$  be the space of all functions from  $\mathbf{R}$  into  $\mathbf{R}$  which are continuous. Let  $\mathbf{T}$  be linear transformation defined by

$$(\mathbf{T}f)(x) = \int_0^x f(t) dt$$

Find the range and null space of  $\mathbf{T}$ .

## 2 EXPLANATION

- a) Let the vector space  $\mathbf{V}$  be defined as

$$\mathbf{V} = \left\{ f : \mathbf{F} \rightarrow \mathbf{F} : f(x) = \sum_{k=0}^n c_k x^k, c_k \in \mathbf{F} \right\} \quad (2.0.1)$$

Differentiation transformation is defined as a function which maps the vectors in  $\mathbf{F}$  into  $\mathbf{F}$  such that

$$(\mathbf{D}f)(x) = \frac{df(x)}{dx} \quad (2.0.2)$$

$$\Rightarrow \mathbf{D}f = \sum_{k=0}^n k c_k x^{k-1} = g(x) \quad (2.0.3)$$

Since  $g(x) \in \mathbf{V}$  therefore the transformation  $\mathbf{D}$  is defined from  $\mathbf{V}$  into  $\mathbf{V}$ . Thus the range of  $\mathbf{D}$  is the entire vector space  $\mathbf{V}$ . Now consider

the nullspace for differentiation transformation defined as

$$\mathbf{N} = \{f \in \mathbf{V} : \mathbf{D}f = 0\} \quad (2.0.4)$$

$$\mathbf{D}f = 0 \Rightarrow f = c \quad (2.0.5)$$

where  $c$  is a constant. Such a polynomial is known as constant polynomial. Therefore

$$\mathbf{N} = \{f = c : f \in \mathbf{V}, c \in \mathbf{F} \text{ where } c \text{ is a constant}\} \quad (2.0.6)$$

- b) Now consider the vector space defined as

$$\mathbf{V} = \{f : \mathbf{R} \rightarrow \mathbf{R} : f \text{ is continuous}\} \quad (2.0.7)$$

Integration transformation is defined as

$$(\mathbf{T}f)(x) = \int_0^x f(t) dt \quad (2.0.8)$$

Let

$$F(x) = \int_0^x f(t) dt \quad (2.0.9)$$

Since  $f$  is continuous function we have  $|f(t)| \leq M \forall t \in [0, x]$  and  $|M| \geq 0$ , it follows that

$$|F(x+h) - F(x)| = \left| \int_0^h f(t) dt \right| \leq M|h| \quad (2.0.10)$$

which shows that  $F(x)$  is also continuous and thus

$$F(x) \in \mathbf{V} \quad (2.0.11)$$

Therefore the transformation  $\mathbf{T}$  is defined from  $\mathbf{V}$  into  $\mathbf{V}$ . Thus the range of  $\mathbf{T}$  is the entire vector space  $\mathbf{V}$ . Now consider the nullspace for integration transformation defined as

$$\mathbf{N} = \{f \in \mathbf{V} : \mathbf{T}f = 0\} \quad (2.0.12)$$

$$\mathbf{T}f = 0 \Rightarrow \int_0^x f(t) dt = 0 \quad (2.0.13)$$

$$\Rightarrow f(t) = 0 \quad (2.0.14)$$

Therefore nullspace for integration transformation is

$$\mathbf{N} = \{0\} \quad (2.0.15)$$

### 3 D AND T TRANSFORMATION MATRICES FOR THE POLYNOMIAL VECTOR SPACE

Let the vector space of n-dimension be defined as

$$\mathbf{V} = \left\{ f : \mathbf{F} \rightarrow \mathbf{F} : f(x) = \sum_{k=0}^n c_k x^k, c_k \in \mathbf{F} \right\} \quad (3.0.1)$$

The corresponding standard basis for  $\mathbf{V}$  is

$$\left\{ \begin{pmatrix} 1 \\ 0 \\ \vdots \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ x \\ \vdots \\ 0 \end{pmatrix}, \dots, \begin{pmatrix} 0 \\ 0 \\ \vdots \\ x^{n-1} \end{pmatrix} \right\} \quad (3.0.2)$$

a) Let  $f$  and  $g \in \mathbf{V}$  and let  $\alpha$  and  $\beta \in \mathbf{F}$  then

$$\mathbf{D}(\alpha f + \beta g) = \frac{d(\alpha f(x) + \beta g(x))}{dx} \quad (3.0.3)$$

$$= \alpha \frac{df(x)}{dx} + \beta \frac{dg(x)}{dx} \quad (3.0.4)$$

$$= \alpha(\mathbf{D}f) + \beta(\mathbf{D}g) \quad (3.0.5)$$

Therefore  $\mathbf{D}$  is a linear transformation.

The  $\mathbf{D}$  transformation maps the  $k^{th}$  basis vector as follows

$$\mathbf{D} \begin{pmatrix} 0 \\ \vdots \\ 0 \\ x^k \\ \vdots \\ 0 \end{pmatrix} = \begin{pmatrix} 0 \\ \vdots \\ kx^{k-1} \\ 0 \\ \vdots \\ 0 \end{pmatrix} \quad (3.0.6)$$

Therefore the  $\mathbf{D}$  Transformation on the basis vector set is

$$\mathbf{D} \begin{pmatrix} 1 & 0 & 0 & \cdots & 0 & 0 \\ 0 & 1 & 0 & \cdots & 0 & 0 \\ 0 & 0 & 1 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 1 & 0 \\ 0 & 0 & 0 & \cdots & 0 & 1 \end{pmatrix} = \begin{pmatrix} 0 & 1 & 0 & \cdots & 0 & 0 \\ 0 & 0 & 2 & \cdots & 0 & 0 \\ 0 & 0 & 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 0 & n-2 \\ 0 & 0 & 0 & \cdots & 0 & 0 \end{pmatrix} \quad (3.0.7)$$

Thus the  $\mathbf{D}$  transformation coefficient matrix is

$$D = \begin{pmatrix} 0 & 1 & 0 & \cdots & 0 & 0 \\ 0 & 0 & 2 & \cdots & 0 & 0 \\ 0 & 0 & 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 0 & n-2 \\ 0 & 0 & 0 & \cdots & 0 & 0 \end{pmatrix} \quad (3.0.8)$$

b) Let  $f$  and  $g \in \mathbf{V}$  and let  $\alpha$  and  $\beta \in \mathbf{F}$  then

$$\mathbf{T}(\alpha f + \beta g) = \int_0^x (\alpha f(t) + \beta g(t)) dt \quad (3.0.9)$$

$$= \alpha \int_0^x f(t) dt + \beta \int_0^x g(t) dt \quad (3.0.10)$$

$$= \alpha(\mathbf{T}f) + \beta(\mathbf{T}g) \quad (3.0.11)$$

Therefore  $\mathbf{T}$  is a linear transformation.

The  $\mathbf{T}$  transformation maps the  $k^{th}$  basis vector as follows

$$\mathbf{T} \begin{pmatrix} 0 \\ \vdots \\ x^k \\ 0 \\ \vdots \\ 0 \end{pmatrix} = \begin{pmatrix} 0 \\ \vdots \\ 0 \\ \frac{x^{k+1}}{k+1} \\ \vdots \\ 0 \end{pmatrix} \quad (3.0.12)$$

Therefore the  $\mathbf{T}$  Transformation on the basis vector set is

$$\mathbf{T} \begin{pmatrix} 1 & 0 & 0 & \cdots & 0 & 0 \\ 0 & 1 & 0 & \cdots & 0 & 0 \\ 0 & 0 & 1 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 1 & 0 \\ 0 & 0 & 0 & \cdots & 0 & 1 \end{pmatrix} = \begin{pmatrix} 0 & 0 & 0 & \cdots & 0 & 0 \\ 1 & 0 & 0 & \cdots & 0 & 0 \\ 0 & \frac{1}{2} & 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 0 & 0 \\ 0 & 0 & 0 & \cdots & \frac{1}{n-1} & 0 \\ 0 & 0 & 0 & \cdots & 0 & \frac{1}{n} \end{pmatrix} \quad (3.0.13)$$

Thus the  $\mathbf{T}$  transformation coefficient matrix is

$$T = \begin{pmatrix} 0 & 0 & 0 & \cdots & 0 & 0 \\ 1 & 0 & 0 & \cdots & 0 & 0 \\ 0 & \frac{1}{2} & 0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 0 & 0 \\ 0 & 0 & 0 & \cdots & \frac{1}{n-1} & 0 \\ 0 & 0 & 0 & \cdots & 0 & \frac{1}{n} \end{pmatrix} \quad (3.0.14)$$
