EE5609 Assignment 12

SHANTANU YADAV, EE20MTECH12001

1 Problem

Let **W** be the subspace of \mathbb{C}^3 spanned by $\alpha_1 = \begin{pmatrix} 1 \\ 0 \\ i \end{pmatrix}$

and $\alpha_2 = \begin{pmatrix} 1 \\ i \\ 1+i \end{pmatrix}$.

b)

- a) Show that α_1 and α_2 form a basis for **W**.
- b) Show that the vectors $\beta_1 = \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix}$ and $\beta_2 = \begin{pmatrix} 1 \\ i \\ 1+i \end{pmatrix}$ are in **W** and form another basis for **W**.
- c) What are the coordinates of α_1 and α_2 in the ordered basis $\{\beta_1, \beta_2\}$ for **W**.

2 EXPLANATION

a) It is given that α_1 and α_2 span **W**. For α_1 and α_2 to be the basis for **W** they must be linearly independent. Let

$$S_1 = {\alpha_1, \alpha_2} = \left\{ \begin{pmatrix} 1\\0\\i \end{pmatrix}, \begin{pmatrix} 1+i\\1\\-1 \end{pmatrix} \right\}$$
 (2.0.1)

Using row reduction on matrix $\mathbf{A} = \begin{pmatrix} \alpha_1 & \alpha_2 \end{pmatrix}$

$$\begin{pmatrix} 1 & 1+i \\ 0 & 1 \\ i & -1 \end{pmatrix} \xrightarrow{R_3 \leftarrow R_3 - iR_1} \begin{pmatrix} 1 & 1+i \\ 0 & 1 \\ 0 & -i \end{pmatrix}$$
 (2.0.2)

Since **A** is a full-rank matrix the column vectors are linearly independent. Therefore $S_1 = \{\alpha_1, \alpha_2\}$ is a basis set for **W**.

$$\beta_1 = \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix} \tag{2.0.3}$$

$$\beta_2 = \begin{pmatrix} 1 \\ i \\ 1+i \end{pmatrix} \tag{2.0.4}$$

Since column vectors of $\mathbf{A} = (\alpha_1 \ \alpha_2)$ are basis for \mathbf{W} and if β_1 and $\beta_2 \in \mathbf{W}$ there exist a unique solution \mathbf{x} such that

$$(\alpha_1 \quad \alpha_2)\mathbf{x} = \beta_1 \tag{2.0.5}$$

Using row reduction on augmented matrix

$$\begin{pmatrix} 1 & 1+i & | & 1 \\ 0 & 1 & | & 1 \\ i & -1 & | & 0 \end{pmatrix}$$
 (2.0.6)

$$\xrightarrow{R3 \leftarrow R_3 - iR - 1} \begin{pmatrix} 1 & 1 + i & | & 1 \\ 0 & 1 & | & 1 \\ 0 & -i & | & -i \end{pmatrix}$$
 (2.0.7)

$$\stackrel{R_3 \leftarrow R_3 - R_2}{\longleftrightarrow} \begin{pmatrix} 1 & 1 + i & | & 1 \\ 0 & 1 & | & 1 \\ 0 & 0 & | & 0 \end{pmatrix}$$
 (2.0.8)

$$\stackrel{R_1 \leftarrow R_1 - (i+1)R_2}{\longleftrightarrow} \begin{pmatrix} 1 & 0 & | & -i \\ 0 & 1 & | & 1 \\ 0 & 0 & | & 0 \end{pmatrix}$$
(2.0.9)

$$\implies$$
 $\mathbf{x} = \begin{pmatrix} -i \\ 1 \end{pmatrix}$ (2.0.10)

Therefore $\beta_1 \in \mathbf{W}$.

Similarly for $\beta_2 \in \mathbf{W}$ there must exist a unique solution \mathbf{x} such that

$$(\alpha_2 \quad \alpha_2) \mathbf{x} = \beta_2$$
 (2.0.11)

Using row reduction on augmented matrix

$$\begin{pmatrix} 1 & 1+i & | & 1 \\ 0 & 1 & | & i \\ i & -1 & | & 1+i \end{pmatrix}$$
 (2.0.12)

$$\xrightarrow{R3 \leftarrow R_3 - iR - 1} \begin{pmatrix} 1 & 1 + i & | & 1 \\ 0 & 1 & | & i \\ 0 & -i & | & 1 \end{pmatrix}$$
 (2.0.13)

$$\stackrel{R_3 \leftarrow R_3 + iR_2}{\longleftrightarrow} \begin{pmatrix} 1 & 1 + i & | & 1 \\ 0 & 1 & | & i \\ 0 & 0 & | & 0 \end{pmatrix}$$
(2.0.14)

$$\stackrel{R_1 \leftarrow R_1 - (i+1)R_2}{\longleftrightarrow} \begin{pmatrix} 1 & 0 & | & 2-i \\ 0 & 1 & | & i \\ 0 & 0 & | & 0 \end{pmatrix} \qquad (2.0.15)$$

$$\implies \mathbf{x} = \begin{pmatrix} 2 - i \\ i \end{pmatrix} \tag{2.0.16}$$

Therefore $\beta_2 \in \mathbf{W}$. Consider

$$S_2 = \{\beta_1, \beta_2\} = \left\{ \begin{pmatrix} 1\\1\\0 \end{pmatrix}, \begin{pmatrix} 1\\i\\1+i \end{pmatrix} \right\}$$
 (2.0.17)

and also let

$$\mathbf{B} = \begin{pmatrix} 1 & 1 \\ 1 & i \\ 0 & 1+i \end{pmatrix} \tag{2.0.18}$$

Using row reduction on matrix **B**

$$\begin{pmatrix} 1 & 1 \\ 1 & i \\ 0 & 1+i \end{pmatrix} \xrightarrow{R_2 \leftarrow R_2 - R_1} \begin{pmatrix} 1 & 1 \\ 0 & i-1 \\ 0 & 1+i \end{pmatrix}$$
 (2.0.19)

Since **B** is a full rank matrix the column vectors are linearly independent.

Let α be any vector in the subspace W, then it can be expressed as span $\{\alpha_1, \alpha_2\}$ i.e

$$\alpha = (\alpha_1 \quad \alpha_2) \mathbf{x_1} = \mathbf{A} \mathbf{x_1} \tag{2.0.20}$$

 $S_2 = \{\beta_1, \beta_2\}$ spans **W** if any vector $\alpha \in \mathbf{W}$ can be expressed as

$$\alpha = (\beta_1, \beta_2) \mathbf{x_2} = \mathbf{B} \mathbf{x_2} \tag{2.0.21}$$

From (2.0.20) and (2.0.21) we conclude

$$\mathbf{B}\mathbf{x}_2 = \mathbf{A}\mathbf{x}_1 \tag{2.0.22}$$

$$\implies \mathbf{x_2} = \mathbf{B}^{-1} \mathbf{A} \mathbf{x_1} \tag{2.0.23}$$

Therefore from (2.0.23) $\mathbf{x_2}$ exists if **B** is invertible. From (2.0.19) we conclude $\mathbf{x_2}$ exists and hence any vector $\alpha \in \mathbf{W}$ can be expressed as span $\{\beta_1, \beta_2\}$. Therefore $\{\beta_1, \beta_2\}$ is basis for **W**.

c) Since $\alpha_1, \alpha_2 \in \mathbf{W}$ and $\{\beta_1, \beta_2\}$ are ordered basis for W there must exist unique value of x such that

$$(\beta_1 \quad \beta_2) \mathbf{x} = \alpha_1 \tag{2.0.24}$$

$$(\beta_1 \quad \beta_2) \mathbf{x} = \alpha_1$$
 (2.0.24)

$$(\beta_1 \quad \beta_2) \mathbf{x} = \alpha_2$$
 (2.0.25)

Using row reduction on (2.0.24) we get,

$$\begin{pmatrix} 1 & 1 & | & 1 \\ 1 & i & | & 0 \\ 0 & 1+i & | & i \end{pmatrix}$$
 (2.0.26)

$$\xrightarrow{R_2 \leftarrow R_2 - R_1} \begin{pmatrix} 1 & 1 & | & 1 \\ 0 & i - 1 & | & -1 \\ 0 & 1 + i & | & i \end{pmatrix}$$
 (2.0.27)

$$\stackrel{R_2 \leftarrow \frac{R_2}{i-1}}{\longleftrightarrow} \begin{pmatrix} 1 & 1 & | & 1 \\ 0 & 1 & | & \frac{1+i}{2} \\ 0 & 1+i & | & i \end{pmatrix}$$
(2.0.28)

$$\xrightarrow{R_3 \leftarrow R_3 - (i+1)R_2} \begin{pmatrix} 1 & 1 & | & 1 \\ 0 & 1 & | & \frac{1+i}{2} \\ 0 & 0 & | & 0 \end{pmatrix}$$
 (2.0.29)

$$\stackrel{R_1 \leftarrow R_2 - R_1}{\longleftrightarrow} \begin{pmatrix} 1 & 0 & | & \frac{1-i}{2} \\ 0 & 1 & | & \frac{1+i}{2} \\ 0 & 0 & | & 0 \end{pmatrix}$$
(2.0.30)

$$\implies \mathbf{x} = \frac{1}{2} \begin{pmatrix} 1 - i \\ 1 + i \end{pmatrix} \tag{2.0.31}$$

and now applying row reduction on (2.0.25) we get,

$$\begin{pmatrix} 1 & 1 & | & 1+i \\ 1 & i & | & 1 \\ 0 & 1+i & | & -1 \end{pmatrix}$$
 (2.0.32)

$$\stackrel{R_2 \leftarrow R_2 - R_1}{\longleftrightarrow} \begin{pmatrix} 1 & 1 & | & 1 + i \\ 0 & i - 1 & | & -i \\ 0 & 1 + i & | & -1 \end{pmatrix}$$
(2.0.33)

$$\stackrel{R_2 \leftarrow \frac{R_2}{i-1}}{\longleftrightarrow} \begin{pmatrix} 1 & 1 & | & 1+i \\ 0 & 1 & | & \frac{-1+i}{2} \\ 0 & 1+i & | & -1 \end{pmatrix}$$
(2.0.34)

$$\stackrel{R_3 \leftarrow R_3 - (i+1)R_2}{\longleftrightarrow} \begin{pmatrix} 1 & 1 & | & 1+i \\ 0 & 1 & | & \frac{-1+i}{2} \\ 0 & 0 & | & 0 \end{pmatrix}$$
(2.0.35)

$$\stackrel{R_1 \leftarrow R_2 - R_1}{\longleftrightarrow} \begin{pmatrix} 1 & 0 & | & \frac{3+i}{2} \\ 0 & 1 & | & \frac{-1+i}{2} \\ 0 & 0 & | & 0 \end{pmatrix}$$
 (2.0.36)

$$\implies \mathbf{x} = \frac{1}{2} \begin{pmatrix} 3+i \\ -1+i \end{pmatrix} \qquad (2.0.37)$$
